OVERVIEW / RESULTS

Paylocity provides cloud-based payroll software to simplify everyday payroll and HR tasks for medium-sized businesses.

Paylocity was unable to update its website, and came to Americaneagle.com for hosting and support. Americaneagle.com conducted a technical audit to see how the website was built, and found that the web pages were hard coded. Because of this, Paylocity was unable to make content updates and grow the website, which is usually the main goal of a CMS like WordPress, which the site is built on.

Americaneagle.com moved the site to host it in-house. The Americaneagle.com team also implemented full-scale visual building tool Visual Composer, so that the Paylocity team could rapidly build and deploy content and

landing pages using drag and drop tools. Through this implementation, the Paylocity team has now regained control of the site without ever having to work in the code.

Americaneagle.com also created custom documentation for Paylocity, to teach its team members how to use Visual Composer. Today, many members of the Paylocity team use the documentation and the tool as part of the daily upkeep of the site.

“Working with Americaneagle.com’s post launch support WordPress team has been a great experience. When our site was built by another developer we had some structural issues which prevented us from making content changes on the fly. Americaneagle.com recommended and implemented a visual editing tool that gave us the power to truly manage our site, and with their collaborative team the experience has been nothing short of spectacular!”
